XML was consciously designed so that it could be effectively processed by "low-tech" solutions, in particular text processors like Perl using regular expressions. As we've just seen, you can't process the file one line at a time, but if your data files are small enough to load entirely into memory, you can parse them with regular expressions. Example 5 shows a version of

XML is a kind of trade language by which data can be transferred from various information systems. It is different from the popular HTML markup language in that XML is used for the transfer and storage of data, whereas HTML is used for the display of data. XML does not itself transport the data, but organizes and stores it in a commonly-recognized way. Users can read the language directly, and ...
